Clinical Case
NobelReplace® Tapered

October, 2011
NobelReplace® Tapered

Dr. Baldwin W. Marchack
United States

Posterior restoration
Male patient
60 years old
Non-smoker
No parafunctional habits

Implant:
NobelReplace Tapered WP
5.0x13mm

FDI POS:
Tooth 36

„After more than 25 years of experience with dental implant treatments, NobelReplace Tapered is still my preferred implant system. I especially like the high restorative flexibility for serving all my patients‘ needs. The consistent performance and clinical outcome makes it an implant I trust for any clinical indication.“
Failed root canal filling and fractured mandibular molar. Grafting of socket after extraction followed by 2.5 months of unloaded healing. Second molar crown to be replaced at a later stage.

Courtesy of Dr. Baldwin Marchack
Placement of a NobelReplace WP 13mm implant with a healing abutment for immediate temporization. Removal of the abutment after two months revealed 2mm of tissue above the implant with a flat tissue architecture, which is an ideal indication for Snappy Abutments.
Seating of a Snappy Abutment 4.0 WP. After impression taking a healing cap was snapped onto the abutment as temporary restoration.

X-ray to confirm proper seating of the Snappy Abutment.
