

Rescue instrumentation

Solutions for
EVERY SITUATION

Product overview

ABUTMENT RETRIEVAL

Removal of an abutment held by a tight conical connection is simple with the Abutment Release Pin.

For titanium and zirconia restorations, including the NobelProcera® Angulated Screw Channel (ASC) abutment and the Full-contour Zirconia (FCZ) implant crown, removal is simplified with a range of dedicated abutment retrieval instruments.

ABUTMENT / CLINICAL SCREW REMOVAL

In the event that an abutment screw breaks, there's a safe solution, even when part of the screw remains in the screw channel.

While the Abutment Screw Remover will resolve the majority of such instances efficiently, Reverse Drills and Abutment Retrieval Instruments enable retrieval in more complex cases.

IMPLANT RETRIEVAL

Managing a retrieval case where the implant driver no longer engages?

The Implant Retrieval Instrument is designed precisely for this scenario, regardless of whether it's due to implant fracture, a damaged connection or strong osseointegration. For more difficult cases, Trephine Drills are available.

Implant retrieval instruments
