Case description
Restoration of a missing lateral incisor

Patient
22 years, male

Clinical situation
Congenitally missing right lateral and peg-shaped left lateral maxillary incisor

Surgical solution
Extraction & immediate placement of NobelActive® TiUltra™ implant

Restorative solution
Temporary: SnapTemp abutment and Tempshell crown
Final: NobelProcera® ASC Full Contour Zirconia Implant Crown

Surgery date(s)
April, 2019

Total treatment time
3 months

Tooth position(s)
12

Patient with congenitally missing right and peg-shaped left lateral incisor.

Orthodontic treatment was carried out to align the teeth and create the correct space for restoration of both lateral incisors.

The maxillary left incisor was restored with a lithium disilicate veneer followed by extraction of right deciduous lateral incisor with immediate placement of a NobelActive® TiUltra™ implant and immediate provisionalisation.

Simultaneous soft tissue augmentation was carried out with sub-epithelial connective tissue graft.
Clinical view of patient with retained deciduous right maxillary lateral incisor and peg-shaped left lateral. Note the poor relative proportions of the incisors, anterior crowding and the lack of adequate space for the maxillary lateral incisors.

Apical root resorption of the retained right lateral incisor.

At 2 months, impressions were taken (both conventional and digital) and shade communication provided to the laboratory. The temporary was refitted.
DTX Studio™ Lab software was utilized to design the zirconia framework for a NobelProcera® ASC Full Contour Zirconia Implant Crown with labial cutback and veneered with porcelain on the labial side (work by Luc & Patrick Rutten).
